

Monitoring

Health surveillance involves monitoring employees exposed to certain health risks or situations for signs of work-related illness or injury.

The information obtained allows employers to manage these risks and assess control measures.

This surveillance provides an opportunity for employee feedback and helps reinforce health and safety messages.

Exposure

Health surveillance is needed for employees exposed to risks such as excessive noise, hand/arm vibration, solvents, fumes, dust, biological agents, asbestos or lead or if their work involves compressed air, ionising radiations or diving.

NB: this is not an exhaustive list.

Risk assessment

A risk assessment is the starting point in a health surveillance programme as it identifies workplace health hazards, employees at risk and control measures needed.

If risks identified cannot be totally removed, measures to safeguard employee health will include health surveillance.

Our credentials

Established in 1962, MOHS is a leading independent provider of occupational health and safety services and medical expertise.

A registered charity, we are committed to the ethos of social enterprise. Any surplus income is invested back into our business to allow continual development and service improvement.

What we do

Our highly experienced team of occupational health advisors work with an organisation to deliver cost effective and efficient health surveillance through assessments such as:

- ♥ hearing
- ♥ vision
- ♥ lung function
- ♥ biological monitoring
- ♥ vibration effects
- ♥ drugs/alcohol screening
